

Summer Internship @Internity

INTERNITY

'TOGETHER WE CAN'

Internships are the best way to convert your knowledge into problem-solving. Every Professional course graduate has to do an internship as a part of the curriculum. Its the best time to practically implement your skills as well as enhance your skills.

This year as a part of my curriculum I have to do my summer internship. I was searching for that from mid of January, I got to know about Internity foundation through Linkedin, there was a post regarding the launch of the summer internship program soon. After that, I visit internity's website every week then finally after waiting there comes the application for the internship. I field the form I want to pursue my career in data science so I choose Data Science as my domain of internship. Then there was the shortlisting and then the interview. After that process, I came to know that I was selected for the Internship.

I was really excited about the internship then on 26 May, there is our orientation program for the internship, In which Rishab sir Introduced us about what Internity foundation is and what our journey of 45 days will be in this internship.

On the first day of our internship, we have allocated our coach and stream head. And then we have a session for trello and GitHub. I have used Github before but trello is totally new to me. Vijendra Sir has taken our trello session in which he introduced us with the platform known as trello. We can manage our day to day task using this platform, this is a very helpful platform which can help us in keeping eye on our tasks. It will be really helpful in our college projects.

I have very high expectations from this internship as I heard a lot about it. Till now we have covered the basics of numpy and pandas and expecting more in the coming future and make this internship a worth.
